

Pilot Customer Setup Guide

This document is for onboarding specialists deploying NexusPOS AI at a new pilot location (e.g., Darjeeling Tea Shop, Cafe, or Restaurant).

1. Hardware Verification

Before arriving on-site, confirm the following hardware is available and operational:

- ☐ **POS Terminal:** Windows/Mac PC or high-end tablet (iPad Pro / Galaxy Tab).
- ☐ **Kitchen Tablet:** iPad or Android tablet (at least 10 inches) mounted in a protective, splash-proof casing.
- ☐ **Receipt Printer:** Thermal 80mm printer (USB, Ethernet, or Bluetooth).
- ☐ **Network:** Dedicated business Wi-Fi (Do not use public guest networks).

2. Software Initialization

1. Navigate to the designated NexusPOS URL for this tenant (e.g., `teashop.nexuspos.ai`).
2. Log in using the provided `owner` credentials.
3. Open **Settings > Business Settings** and enter the client's actual legal data to ensure initial compliance.
4. Pair the thermal printer with the POS terminal OS (Windows/iOS) and run a test print from Notepad to ensure driver compatibility.

3. Data Migration & Menu Build

If the client is transitioning from an old POS:

1. Request an Excel/CSV export of their old menu.
2. Manually create the Categories in NexusPOS.
3. Manually add the top 20 highest-selling items first to ensure they can trade immediately.
4. *(Bulk CSV import is planned for Phase 2).*

4. On-Site Staff Training

Conduct a 30-minute interactive session:

1. **Cashiers:** Have them process a fake order with split payments. Show them how to void an item.
2. **Kitchen:** Have them tap the tablet to move the fake order from PENDING to SERVED. Ensure they hear the audio chime.

5. Hypercare Handover

- Leave a printed copy of the **Quick Start Guide** by the till.
- Provide the manager with the direct phone number for IT support during the first 48 hours of trading.
