

Troubleshooting Guide

This guide covers the most common issues you might encounter during daily operations and how to resolve them immediately.

1. Hardware & Connectivity Issues

1.1 The receipt printer is not printing.

Symptom: You click "Print" on the POS, but nothing happens. **Solution:**

1. Check if the printer has paper and the green power light is on.
2. Check the USB/Bluetooth connection to the computer/tablet.
3. If using Windows, open the "Printers & Scanners" menu and ensure the thermal printer is set as the "Default Printer".
4. Refresh the NexusPOS browser tab.

1.2 The KDS (Kitchen Tablet) is not receiving new orders.

Symptom: Cashiers are ringing up food, but the kitchen screen is empty. **Solution:**

1. Check the Wi-Fi connection on the tablet. NexusPOS Realtime requires an active internet connection.
 2. If the Wi-Fi dropped momentarily, refresh the browser page. The system will automatically fetch all missed PENDING orders from the server.
 3. Ensure the tablet is not on the "Lock Screen" or "Sleep Mode".
-

2. Point of Sale (POS) Issues

2.1 The barcode scanner isn't adding items to the cart.

Symptom: You scan a Coke, but it doesn't appear in the cart. **Solution:**

1. Click your mouse cursor inside the "**Search Menu Items**" text box at the top of the POS screen.
2. The barcode scanner acts like a keyboard; it must have a text field focused to input the barcode digits.

2.2 I made a mistake on a payment, but the order is closed.

Symptom: You hit "CASH" but the customer actually paid with "CARD", and the receipt already printed. **Solution:**

1. Currently, closed orders cannot be modified by cashiers for security reasons.
 2. Call a Manager. The Manager must log in, void the original order from the orders screen, and ring it up again correctly.
-

3. Inventory & Reporting Issues

3.1 Inventory shows negative numbers.

Symptom: Coffee Beans show -5 kg in stock. **Solution:**

1. This happens when you sell menu items, but you forgot to tell the system you received a new delivery from your supplier.
2. To fix it, go to **Inventory > Items**, click the item, and perform a **Manual Adjustment** to add the correct current physical stock.

3.2 "Today's Sales" doesn't match the cash in the drawer.

Symptom: The Analytics dashboard says \$500, but the drawer only has \$300. **Solution:**

1. "Today's Sales" shows *Total Revenue* (Cash + Card + UPI).
2. Look at the **Payment Breakdown** pie chart on the dashboard to see exactly how much of that \$500 was supposed to be physical Cash.
3. If the Cash breakdown says \$300, your drawer is perfectly balanced!
